Finance & Governance

What are eco-fiscal tools ?

Similar terms

Environmental taxation

Ecological taxation

Green taxation

Environmentally related
tax revenue

Definition

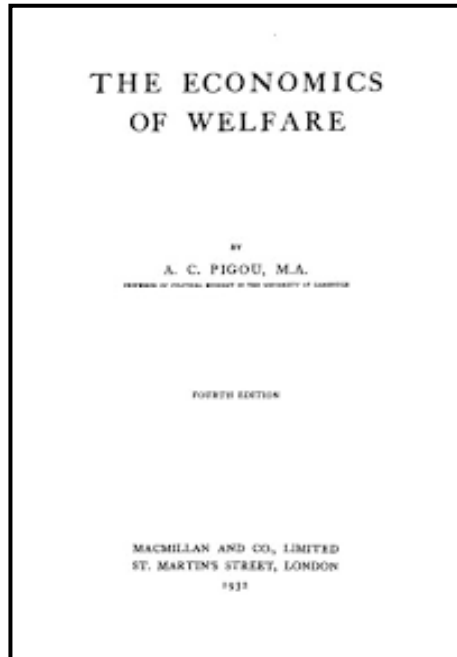

“Any form of municipal levy (including taxes, fees and charges) that has a direct or indirect impact on a behaviour or pollutant that deteriorates the environment or results in the loss of natural resources.”

Benefits of eco-fiscal tools

The concept of double dividend

Improve the
environment

Improve tax
efficiency

Coercive
measures

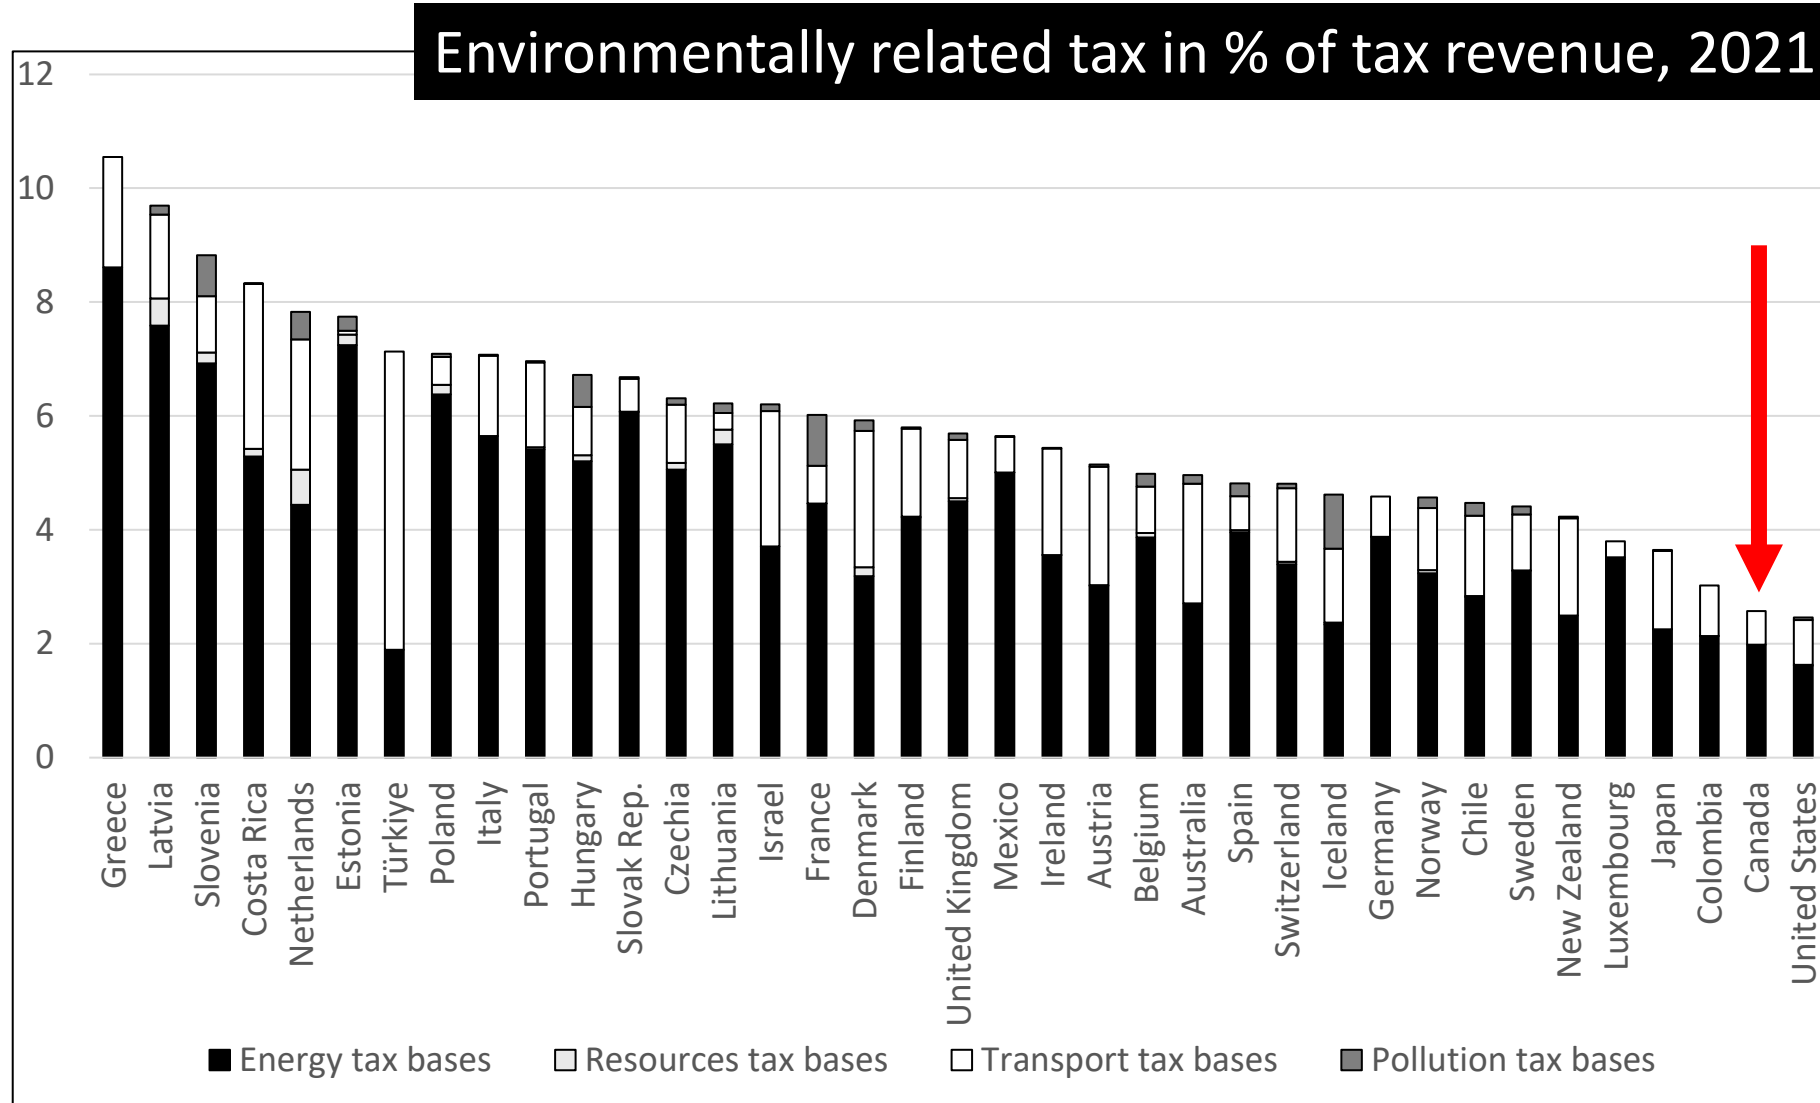

Rules and
regulations

Eco-fiscal
measures

The importance of eco-fiscal tools in Canada

Legal basis of municipal eco-fiscal tools

- **Tax**

- Economic levy with no link to the payer's right to a public service
- Direct tax
- General taxation power or specific power

- **Regulatory charge**

- Payment collected by a public authority associated with its regulatory regime.
- Must focus on either of two objectives:
 - 1) collect money to finance exclusively the regulatory regime (e.g. development charges);
 - 2) induce behavioral changes of the person who pays.

- **User fee**

- "Price tag" imposed on users in exchange for access to public services received or made available.
- User-pay principle, employed to partially fund municipal services.

Behavioural changes: induced by disincentives and incentives

- **Taxes, regulatory charges & user fees**
 - Because they often vary according to actual consumption or use, they can influence the behaviour of the users sensitive to price tag (residents, businesses or institutions) and thus may promote resource conservation.
 - They can also influence behavior by funding programs, infrastructure or services that generate environmental benefits.

Municipalities and eco-fiscal measures

<i>Objective</i>	<i>Sustainable mobility</i>	<i>Urban planning and development</i>	<i>Air quality and reduction of GHG emissions</i>	<i>Drinking water and wastewater</i>	<i>Residual materials destined for landfill</i>
<i>Withdrawal</i>					
<i>Tax</i>	Motor vehicle registration tax	Tax on parking spaces FAR tax Vacant commercial property tax No-tree frontage tax Vacant home tax	Tax on oil heating or dual-energy appliances	-	-
<i>Regulatory charges</i>	Regulatory charges on major trip generators Development cost charges (for transit) Regulatory charges on parcel delivery	Regulatory charge for recultivating unused farmland Regulatory charge to reduce canopy loss Revitalization levies Development charges	Charge to offset GHGs associated with real estate development	Stormwater charges Drinking water use and treatment charges	Levy on single-use or individual containers Regulatory charge on construction, renovation and demolition waste
<i>User fees</i>	Tax for transit service Variable pricing/parking stickers	-	-	Drinking water and wastewater fees	Incentive pricing for the collection and treatment of residual materials

Does it work ?

yes!

Does it work ?

Carbon tax reduces carbon emissions, stimulates innovation and improves the environment

Pricing helps to manage drinking water sustainably

Incentive-based pricing contributes to waste reduction

Road pricing (congestion charges) improves sustainable urban mobility

What's the problem then?

Distributional effects

Although the global impact of an eco-fiscal measure can be positive, there will always be winners and losers.

Administrative costs

Some measures are expensive to implement.
